

Here is the pipe line excavation performed by community. Our office team shows the water flowing root and divides the distance covered by each village community. They also follow the required depth of excavation.

The beginning phase of water tank (reservoir): the volume of the tanker is 250 m³ constructed along the road side.

Renovation of spring capturing: initially made by government but almost became out of use

The wet well construction: the captured water flow to wet well and treated there before pumping to the reservoir.
